

Source File: ~/2336/19/lab19.(C|CPP|cpp|c++|cc|cxx|cp)
Input: under control of `main` function
Output: under control of `main` function
Value: 1

Write a recursive boolean function that determines if a string is a palindrome. A palindrome is a word, verse, or sentence that is the same when read backward or forward. A sample `main` function for testing your function is shown in Figure 1. Commands to compile, link, and run this assignment are shown in Figure 2. Your function should perform comparisons in a case-insensitive manner. To use the `Makefile` as distributed in class, add a target of `lab19` to `targets2srcfiles`.

```
1 #include <iostream>
2 #include <cstdlib>
3 #include <cctype>
4 #include <string>
5
6 using namespace std;
7
8 // isPalindrome is a recursive function that returns true if string s
9 // is a palindrome and false otherwise
10 bool isPalindrome(string s);
11
12 // rmPuncSpaces returns string s with all punctuation and whitespace
13 // characters removed
14 string rmPuncSpaces(string s);
15
16 int main()
17 {
18     string str;
19
20     while (getline(cin, str))
21     {
22         cout << str;
23         str = rmPuncSpaces(str);
24         cout << " is ";
25         if (!isPalindrome(str))
26             cout << "not ";
27         cout << "a palindrome" << endl;
28     }
29
30     return EXIT_SUCCESS;
31 }
32
```

Figure 1. /usr/local/2336/src/lab19main.C (Part 1 of 2)

```
33  string rmPuncSpaces(string str)
34  {
35      // base case for stopping recursion
36      if (str.length() == 0)
37          return str;
38
39      // general case; if the first character of str is either whitespace
40      // or punctuation, recurse with the first character (index 0) from
41      // str removed
42      else if (isspace(*(str.begin())) || ispunct(*(str.begin())))
43          return rmPuncSpaces(str.substr(1));
44
45      // general case continued; if the first character of str is neither
46      // whitespace nor punctuation, return the concatenation of the first
47      // character and the value from recursing with the first character
48      // (index 0) from str removed
49      else
50          return *(str.begin()) + rmPuncSpaces(str.substr(1));
51 }
```
